

FACT

You can be
asymptomatic or
presymptomatic
and still transmit
COVID-19.

Asymptomatic means that you have contracted the Coronavirus but do not present signs of infection. In some cases, you may never develop symptoms.

Presymptomatic means that you have acquired the virus, show no signs of infection, but later you develop symptoms.

Symptoms of COVID-19 infection may not appear for 10-14 days. During this time, you are highly contagious and can still pass COVID-19 to others. You may feel healthy and that the Coronavirus has no impact on you — consider how your behaviors are impacting others and how their behaviors are affecting you.

You are in control of your own decisions.

That's why it's so important to wear a mask, wash your hands frequently, and avoid large crowds. Limit your social circle to your roommates, your household, or just a few friends who practice healthy behaviors and good hygiene.
